

Color profiles are data files that contain a description of how a particular paper, ink, and printer create all colors, shades, and densities. Using a profile will result in more accurate and consistent output.

Printer: Canon Pro-2000 Pro-4000

Setting Recommendations

Manual Color Adjustment Matching: None

Print Quality: High or Highest, your choice.

Config File Availability

Canon printers can utilize media configuration files (AM1X) to define certain printer settings once selected. They are not required to get good prints. If you are using standard photo papers such as 68lb. UltraPro Satin, 60lb. Polar Matte, and similar products you can use the media setting recommendation on the following page and a printer profile for excellent results.

 Config files are recommended for heavy, thick, and specialty papers as they set paper thickness, vacuum strength, and ink density. If you do not use the config file, set paper thickness on the printer's control panel before printing.

Some Hints

 Unless you are using an AM1X media config file for the paper, the name of the paper you are using will not be listed in the media setting drop down menu in the printer driver. That menu only has the names of manufacturer papers.

Do not use the printer driver's "Preview before printing feature". It can interrupt the color management process.

MEDIA SETTING RECOMMENDATIONS

Paper	Media Setting	Special
68lb. UltraPro Satin 4.0	Canon Photo Paper Pro Luster	Config file available
